

~~Q.2 If $u = f\left(\frac{y}{x}\right)$, show that $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 0$.~~ (2017)

Sol. We have,

$$\frac{\partial u}{\partial x} = \left[f' \left(\frac{-y}{x} \right) \right] \left(\frac{-y}{x^2} \right)$$

(Diff. partially w.r.t. x)

∴

$$x \frac{\partial u}{\partial x} = -\left(\frac{y}{x} \right) f' \left(\frac{y}{x} \right) \quad \dots(i)$$

Again,

$$\frac{\partial u}{\partial y} = \left[f' \left(\frac{y}{x} \right) \right] \cdot \left(\frac{1}{x} \right)$$

(Diff. partially w.r.t. y)

∴

$$y \left(\frac{\partial u}{\partial y} \right) = \left(\frac{y}{x} \right) f' \left(\frac{y}{x} \right) \quad \dots(ii)$$

Adding Eqs. (i) and (ii), we get

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 0 \quad \text{Proved.}$$

~~Q.3. If $z = \tan(y+ax) + (y-ax)^{3/2}$, then find the value of $(\partial^2 z / \partial x^2) - a^2 (\partial^2 z / \partial y^2)$.~~

Sol. Given, $z = \tan(y+ax) + (y-ax)^{3/2}$

$$\therefore \left(\frac{\partial z}{\partial x} \right) = \{\sec^2(y+ax)\} \cdot a + \frac{3}{2}(y-ax)^{1/2} \cdot (-a)$$

$$\text{and } \left(\frac{\partial^2 z}{\partial x^2} \right) = 2a^2 \tan(y+ax) \sec^2(y+ax) + \frac{3}{4}a^2(y-ax)^{-1/2}$$

$$\text{Again, } \left(\frac{\partial z}{\partial y} \right) = \sec^2(y+ax) + \frac{3}{2}(y-ax)^{1/2}$$

$$\text{and } \left(\frac{\partial^2 z}{\partial y^2} \right) = 2\sec^2(y+ax) \tan(y+ax) + \frac{3}{4}(y-ax)^{-1/2}$$

$$\text{Thus, } \left(\frac{\partial^2 z}{\partial x^2} \right) - a^2 \left(\frac{\partial^2 z}{\partial y^2} \right) = 0$$

Ans.

64

Q.4. If $u = e^{xyz}$, then show that

$$\frac{\partial^3 u}{\partial x \partial y \partial z} = (1 + 3xyz + x^2 y^2 z^2) e^{xyz}.$$

Sol. Given, $u = e^{xyz}$

$$\therefore \frac{\partial u}{\partial z} = xy e^{xyz}$$

$$\text{Now, } \frac{\partial^2 u}{\partial y \partial z} = \frac{\partial}{\partial y} \left(\frac{\partial u}{\partial z} \right) = \frac{\partial}{\partial y} (xy e^{xyz}) = x \frac{\partial}{\partial y} (ye^{xyz}) \\ = x [y \cdot xze^{xyz} + e^{xyz}] = e^{xyz} (x^2 yz + x)$$

$$\text{Again, } \frac{\partial^3 u}{\partial x \partial y \partial z} = \frac{\partial}{\partial x} \left(\frac{\partial^2 u}{\partial y \partial z} \right) = \frac{\partial}{\partial x} [e^{xyz} (x^2 yz + x)] \\ = e^{xyz} (2xzy + 1) + yze^{xyz} (x^2 yz + x) \\ = e^{xyz} (2xyz + 1 + x^2 y^2 z^2 + xyz) \\ = e^{xyz} (1 + 3xyz + x^2 y^2 z^2)$$

Proved.

Q.5. Find $\frac{\partial f}{\partial x}$, if $f = ye^{(x^2+y^2)}$.

(2016)

Sol. Given,

$$f = ye^{(x^2+y^2)}$$

Taking log on both sides,

$$\log f = \log y + (x^2 + y^2)$$

$$\frac{1}{f} \frac{\partial f}{\partial x} = 0 + 2x + 0$$

$$\frac{\partial f}{\partial x} = 2x \cdot ye^{(x^2+y^2)}$$

Ans.

Q.6. Find $\frac{\partial f}{\partial n}$, if $f = \log(x^2 + y^2)$.

Sol. Given, $f = \log(x^2 + y^2)$

$$|\nabla f| = \frac{\partial f}{\partial n}$$

$$\nabla f = i \frac{\partial f}{\partial x} + j \frac{\partial f}{\partial y} = i \frac{2x}{(x^2 + y^2)} + j \frac{2y}{x^2 + y^2}$$

$$|\nabla f| = \sqrt{\frac{4x^2}{(x^2 + y^2)^2} + \frac{4y^2}{(x^2 + y^2)^2}} = \frac{2}{\sqrt{x^2 + y^2}}$$

Ans.

Q.7. If $x^y + y^x = a^b$, then find dy/dx .

Sol. Let $f(x, y) = x^y + y^x - a^b$

Then, we have $f(x, y) = 0$

$$\therefore \frac{dy}{dx} = -\frac{\partial f / \partial x}{\partial f / \partial y} = \frac{yx^{y-1} + y^x \log y}{x^y \log x + xy^{x-1}}$$

Ans.

Q.8. Show that the differential equation $d^2x/dy^2 = a$ may be written in the form $(d^2y/dx^2) + a(dy/dx)^3 = 0$.

Sol. We have,

$$\frac{dx}{dy} = \left(\frac{dy}{dx} \right)^{-1}$$

... (i)

$$\begin{aligned}\frac{d^2x}{dy^2} &= \frac{d}{dy} \left(\frac{dx}{dy} \right) = \frac{d}{dy} \left\{ \left(\frac{dy}{dx} \right)^{-1} \right\} \\ &= \frac{d}{dx} \left\{ \left(\frac{dy}{dx} \right)^{-1} \right\} \cdot \frac{dx}{dy} = - \left(\frac{dy}{dx} \right)^{-2} \cdot \frac{d^2y}{dx^2} \cdot \left(\frac{dy}{dx} \right)^{-1} \\ &= - \left(\frac{dy}{dx} \right)^{-3} \frac{d^2y}{dx^2}\end{aligned}$$

[From Eq. (i)]

Hence, the differential equation $d^2x/dy^2 = a$ becomes

$$\begin{aligned}- \left(\frac{dy}{dx} \right)^{-3} \frac{d^2y}{dx^2} &= a \quad \text{or} \quad \frac{d^2y}{dx^2} = -a \left(\frac{dy}{dx} \right)^3 \\ \text{or} \quad (d^2y/dx^2) + a(dy/dx)^3 &= 0\end{aligned}$$

Proved.

Q.9. Find the value of $\frac{\partial^2 z}{\partial x \partial y}$, when $z = \sin^{-1} \left(\frac{x}{y} \right)$.

Sol. Given,

$$z = \sin^{-1} \left(\frac{x}{y} \right)$$

$$\therefore \frac{\partial z}{\partial x} = \frac{1}{\sqrt{1-(x/y)^2}} \cdot \frac{1}{y} = \frac{1}{\sqrt{y^2-x^2}} = (y^2-x^2)^{-1/2}$$

Now,

$$\begin{aligned}\frac{\partial^2 z}{\partial x \partial y} &= \frac{\partial}{\partial y} \left(\frac{\partial z}{\partial x} \right) \\ &= \frac{\partial}{\partial y} [(y^2-x^2)^{-1/2}] = -\frac{1}{2}(y^2-x^2)^{-3/2} \cdot 2y \\ &= \frac{-y}{(y^2-x^2)^{3/2}}\end{aligned}$$

Ans.

Q.10. If $u = x^2 y^2 / (x+y)$, then show that $x \left(\frac{\partial u}{\partial x} \right) + y \left(\frac{\partial u}{\partial y} \right) = 3u$.

$$\text{Sol. Given, } u = \frac{x^2 y^2}{x+y} = \frac{x^3 (y/x)^2}{[1+(y/x)]} = x^3 f(y/x), \quad (\text{say})$$

Thus, u is a homogeneous function of x and y of degree 3.

Therefore, by Euler's theorem, we have

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 3u$$

Proved.

Q.11. Define maximum value.

Ans. A function $f(x, y)$ is said to have a maximum value at $x=a, y=b$, if there exists a small neighbourhood of (a, b) such that

$$f(a, b) > f(a+h, b+k).$$

Q.12. What is extreme or extremum value?

Ans. The maximum and minimum values of a function are also called extreme or extremum values of the function.

Section-B (Short Answer Questions)

Q.1. If u be a homogeneous function of degree n , show that

$$x \frac{\partial^2 u}{\partial x^2} + y \frac{\partial^2 u}{\partial x \partial y} = (n-1) \frac{\partial u}{\partial x}$$

Sol. Let u be a homogeneous function of degree n , then by Euler's theorem,

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = nu$$

Partially differentiating w.r.t. x , we get

$$\frac{\partial}{\partial x} \left(x \frac{\partial u}{\partial x} \right) + y \frac{\partial^2 u}{\partial x \partial y} = n \frac{\partial u}{\partial x}$$

$$\left(x \frac{\partial^2 u}{\partial x^2} + \frac{\partial u}{\partial x} \right) + y \frac{\partial^2 u}{\partial x \partial y} = n \frac{\partial u}{\partial x}$$

$$x \frac{\partial^2 u}{\partial x^2} + y \frac{\partial^2 u}{\partial x \partial y} = (n-1) \frac{\partial u}{\partial x}$$

Proved.

Q.2. If $u = \tan^{-1} \left(\frac{y}{x} \right)$, show that $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 0$. (2018)

Sol. We have,

$$u = \tan^{-1} \left(\frac{y}{x} \right) \Rightarrow \tan u = \frac{y}{x}$$

Let

$$f(x, y) = \frac{y}{x} = \tan u$$

f is a homogeneous function of degree 0 in x, y .

Thus, by Euler's theorem on homogeneous functions,

$$x \frac{\partial f}{\partial x} + y \frac{\partial f}{\partial y} = 0 \quad \dots(i)$$

Now,

$$f(x, y) = \tan u$$

$$\therefore \frac{\partial f}{\partial x} = \sec^2 u \frac{\partial u}{\partial x} \quad \text{and} \quad \frac{\partial f}{\partial y} = \sec^2 u \frac{\partial u}{\partial y}$$

Putting these values in Eq. (i), we get

$$x \sec^2 u \frac{\partial u}{\partial x} + y \sec^2 u \frac{\partial u}{\partial y} = 0$$

$$\Rightarrow \sec^2 u \left(x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} \right) = 0$$

$$\Rightarrow x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 0$$

Proved.

Q3. If $u = \tan^{-1} \frac{xy}{\sqrt{(1+x^2+y^2)}}$, then show that $\frac{\partial^2 u}{\partial x \partial y} = \frac{1}{(1+x^2+y^2)^{3/2}}$.

Sol. Given,

$$u = \tan^{-1} \frac{xy}{\sqrt{(1+x^2+y^2)}}$$

Differentiating partially w.r.t x , we get

$$\frac{\partial u}{\partial x} = \frac{1}{1 + \frac{x^2 y^2}{1+x^2+y^2}}$$

$$y \cdot \frac{1 \cdot \sqrt{(1+x^2+y^2)} - x \cdot \frac{1}{2}(1+x^2+y^2)^{-1/2}(-2x)}{1+x^2+y^2}$$

$$= \frac{1+x^2+y^2}{1+x^2+y^2+x^2y^2} \cdot y \cdot \frac{(1+x^2+y^2)-x^2}{(1+x^2+y^2)(1+x^2+y^2)^{1/2}}$$

$$= \frac{y(1+y^2)}{(1+x^2)(1+y^2)(1+x^2+y^2)^{1/2}}$$

$$= \frac{1}{1+x^2} \cdot \frac{y}{(1+x^2+y^2)^{1/2}}$$

$$\frac{\partial^2 u}{\partial x \partial y} = \frac{\partial}{\partial y} \left(\frac{\partial u}{\partial x} \right)$$

$$= \frac{1}{1+x^2} \cdot \frac{1 \cdot (1+x^2+y^2)^{1/2} - y \cdot \frac{1}{2}(1+x^2+y^2)^{-1/2} \cdot 2y}{1+x^2+y^2}$$

$$= \frac{1}{1+x^2} \cdot \frac{1+x^2+y^2-y^2}{(1+x^2+y^2)(1+x^2+y^2)^{1/2}}$$

$$= \frac{1}{1+x^2} \cdot \frac{1+x^2}{(1+x^2+y^2)^{3/2}}$$

$$= \frac{1}{(1+x^2+y^2)^{3/2}}$$

Proved.

Q4. If $u = \sin^{-1} \left(\frac{x^2+y^2}{x+y} \right)$, then show that $x \left(\frac{\partial u}{\partial x} \right) + y \left(\frac{\partial u}{\partial y} \right) = \tan u$. (2016)

Sol. Given,

$$\sin u = (x^2+y^2)/(x+y)$$

$$\log \sin u = \log(x^2+y^2) - \log(x+y) \quad \dots(i)$$

Differentiating Eq. (i) partially w.r.t x , we get

$$\frac{1}{\sin u} \cos u \cdot \frac{\partial u}{\partial x} = \frac{2x}{x^2+y^2} - \frac{1}{x+y}$$

$$(\cot u)x \frac{\partial u}{\partial x} = \frac{2x^2}{x^2+y^2} - \frac{x}{x+y} \quad \dots(ii)$$

Again differentiating Eq. (i) partially w.r.t. y , we get

$$\frac{\cos u}{\sin u} \cdot \frac{\partial u}{\partial y} = \frac{2y}{x^2 + y^2} - \frac{1}{x+y}$$

$$(\cot u) \cdot y \frac{\partial u}{\partial y} = \frac{2y^2}{x^2 + y^2} - \frac{y}{x+y}$$

Adding Eqs. (ii) and (iii), we get

$$(\cot u) \left(x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} \right) = \frac{2x^2 + 2y^2}{x^2 + y^2} - \frac{x+y}{x+y} = 2 - 1 = 1$$

$$x \left(\frac{\partial u}{\partial x} \right) + y \left(\frac{\partial u}{\partial y} \right) = \left(\frac{1}{\cot u} \right) = \tan u$$
